

To position the monkey logo to the center, we just need to use “justify-content: center”. We can also use this code to position it to left or right.

The border of the navigation bar set to 30px make it looks more smooth. It will follow the browser width. It will hide and move to left-hand-side when the screen’s width smaller than 641px.

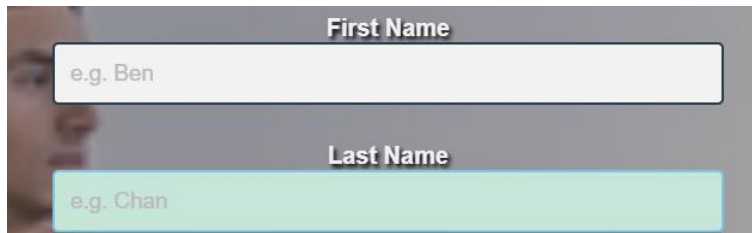

The login bar will also change to “display: block” when the screen’s width smaller than 641px to prevent the word and text box overlapping.

The footer will change 4 times when the screen's width change to make it smoother.

This is the most complicated part of index page. The slider and image inside the slider's radius set to 20px. And it store 4 images display flex and hidden the overflow. The button below the image can control the display image. You just need to click it to change the image. The image will auto change with the JavaScript. It will loop from no.1 to no.4 and the image can be add or minus by changing the CSS code and html code.
